EXPERIMENT – 6

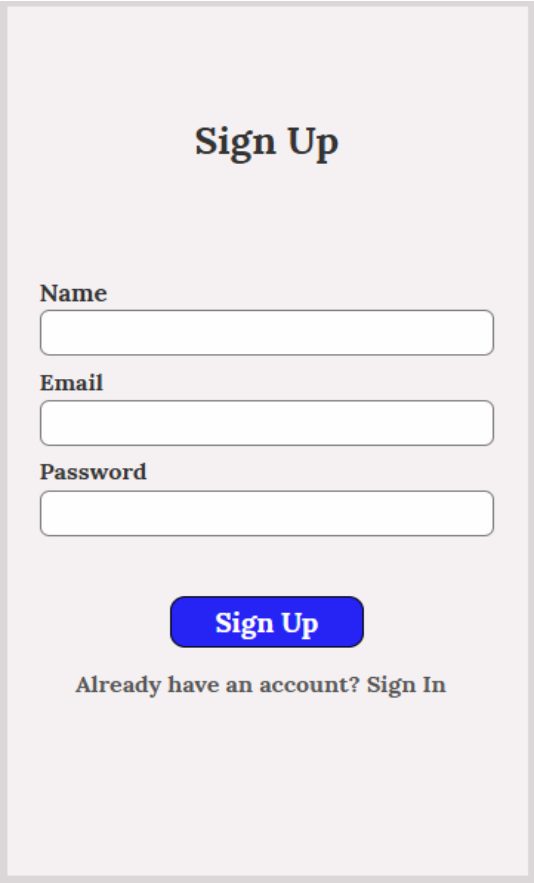
NAME: VEDHASREE S

REGISTER NUMBER: 240701580

Simulate the lifecycle stages for UI design using the RAD model and develop a small interactive interface.

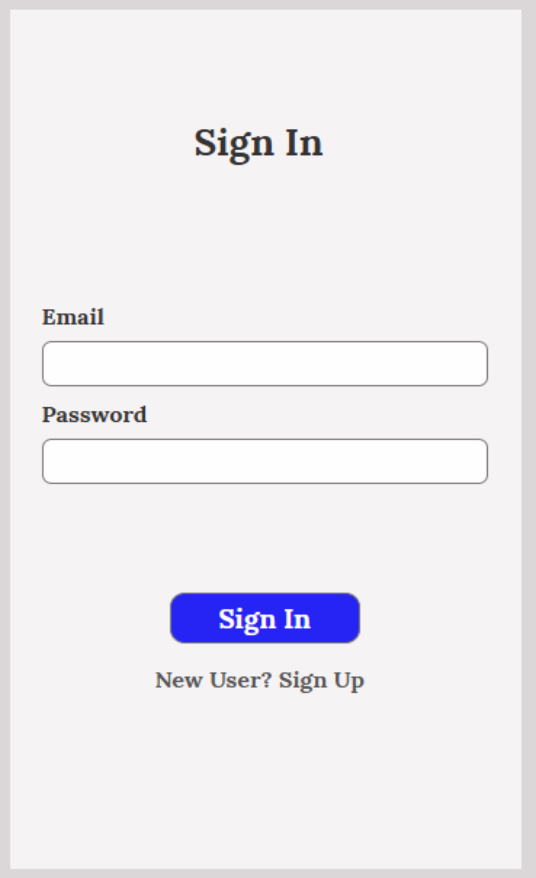
In this experiment, a Food Delivery App was developed using the RAD model. First, the requirements planning stage involved deciding the features and flow of the app, including Sign Up, Sign In, Home, Menu, Cart, Payment, UPI, and Order Confirmation screens. Next, during the user design stage, the screens were created in Axure RP with buttons, text fields, and labels arranged for a mobile layout. In the construction stage, interactivity was added so that users could navigate between screens, add items to the cart, and complete the order. Finally, in the testing stage, the prototype was previewed to ensure smooth navigation and a realistic user experience.

Sign Up



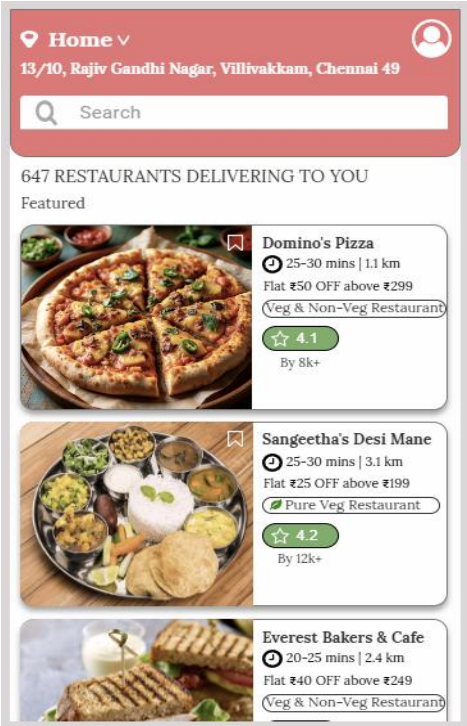
- This screen allows new users to create an account.
- It contains fields for Name, Email, and Password.
- A Sign Up button submits the information.
- A link “Already have an account? Sign In” navigates to the Sign In screen.

Sign In



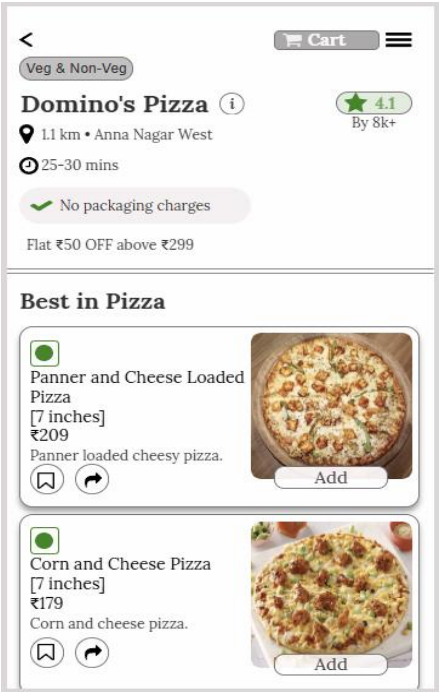
- Existing users can log in from this screen.
- It has fields for Email and Password.
- The Sign In button takes the user to the Home screen.
- A link “New user? Sign Up” navigates to the Sign Up screen.

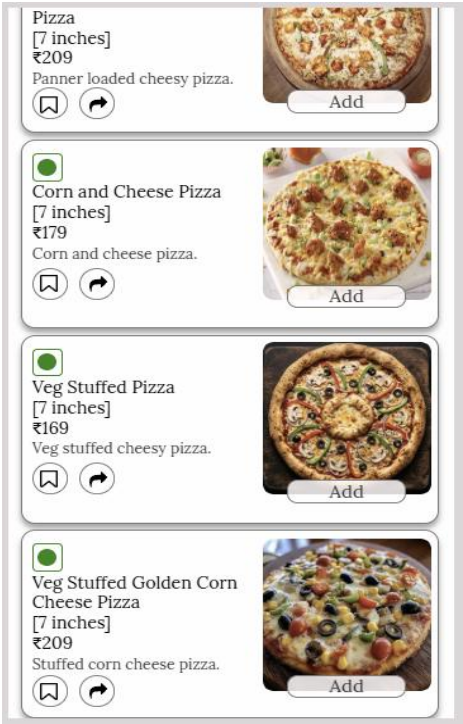
Home Screen



- Displays a list of restaurants as buttons.
- Users select a restaurant to view its menu.
- Clicking a restaurant navigates to the Menu screen.
- The screen has a search bar where the users can search their preferred restaurant.

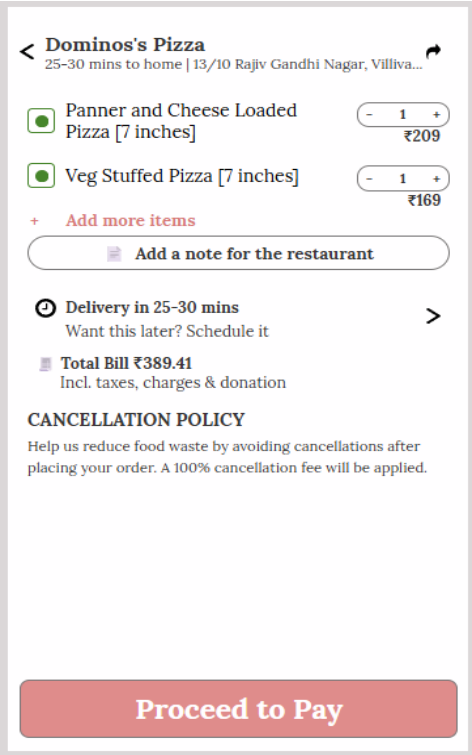
Menu Screen





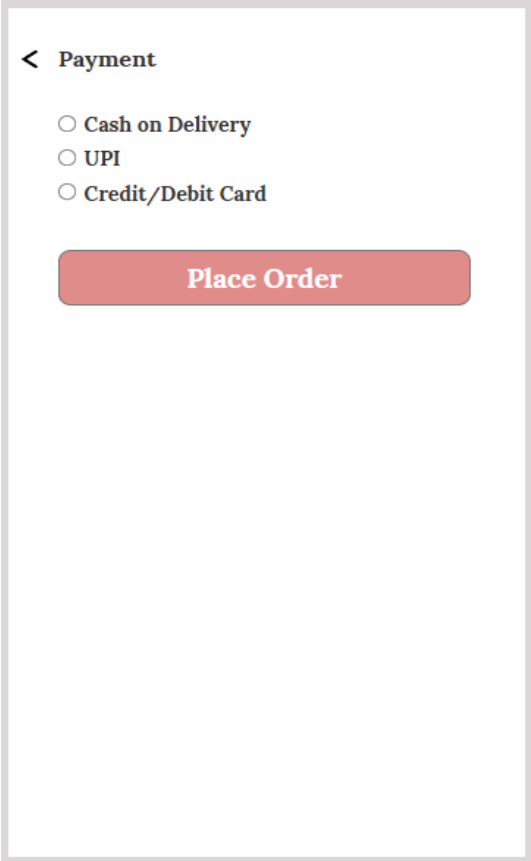
- Shows the food items available in the selected restaurant.
- Each item has an Add button to include it in the cart.
- A Cart button is available to view selected items.
- The screen is scrollable if there are many items.

Cart Screen



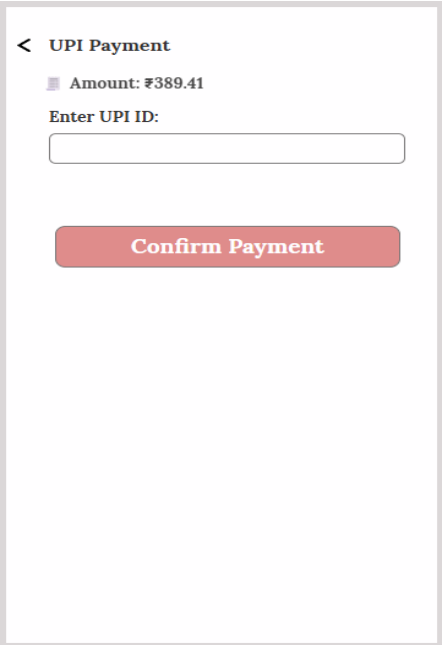
- Lists all selected items along with their prices and users can also increase the quantity if they want.
- Shows the total amount to be paid along with other necessary information about order and delivery.
- A Proceed to Payment button navigates to the Payment screen.

Payment Screen



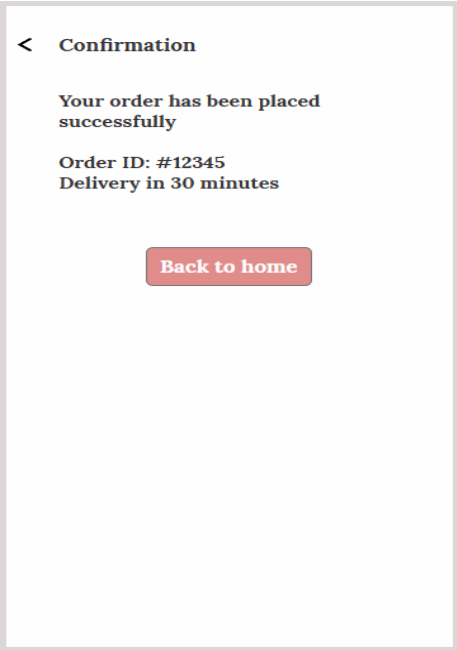
- Provides payment options: Cash on Delivery, UPI, or Card.
- Users select their preferred method.
- Clicking Place Order navigates to the UPI screen if UPI is selected, or directly to the Confirmation screen for other options.

UPI Payment Screen



- Allows the user to complete payment using UPI.
- Contains a field to enter the UPI ID and shows the payment amount.
- A Confirm Payment button completes the transaction and navigates to the Order Confirmation screen.

Order Confirmation Screen



- Displays a message confirming that the order has been successfully placed.

- Optional details such as Order ID and estimated delivery time are shown.
- A Back to Home button allows the user to return to the Home screen.

RAD Lifecycle Stages

Requirements Planning

- In this stage, the objectives of the application were identified.
- A Food Delivery App interface was selected for development.
- The main features such as user registration, login, restaurant selection, menu display, cart, payment, UPI option, and order confirmation were determined.
- The overall navigation flow between the screens was also planned.

User Design

- In this stage, the structure of the user interface was designed.
- Screens such as Sign Up, Sign In, Home, Menu, Cart, Payment, UPI, and Order Confirmation were created.
- Each screen was arranged in a mobile layout using labels, text fields, and buttons.
- The interaction flow between screens was defined to ensure a logical sequence.

Construction

- In this stage, the prototype was developed using Axure RP.
- UI components were placed on each screen according to the design.
- Clickable interactions were added to simulate navigation between screens.
- The complete flow from login to order confirmation was implemented.

Testing / Cutover

- In this stage, the prototype was executed using preview mode.
- All navigation links were tested to verify proper functioning.
- The interface was reviewed to ensure smooth user interaction.
- Necessary adjustments were made to improve usability.
